

ABSTRACT OF THE DISCLOSURE

A method and system for providing a service that delivers location information associated with a caller. The service operates in both wireline and wireless networks, providing called parties with the location information of calling parties who use either stationary terminal devices or mobile devices. The service can operate as a stand alone service or can be a part of a calling name delivery service (or caller-ID service), delivering location information in addition to the conventional name, number, date, and time. The primary components of the present invention include a service control point, an address database in communication with the service control point, and a network that tracks the locations of mobile network users. The system further includes a mapping converter if the location data provided by the network is not meaningful to a subscriber.
